

HEAVILY MODIFIED WATER BODIES IN POLAND

- At present, in pilot river basins, researches concerning detailed identification of heavily modified water bodies are being carried out (e.g.: Upper Vistula basin up to Raba's estuary)
- For the identification of heavily modified water bodies, border factors, which are adapted to present information on hydromorphological changes are being set; they concern:
 - essential hydrological regime changes,
 - important morphological changes caused by cross and elongate rivers and streams development,
 - the influence of rivers and streams control.
- Many hydrobiological and morphological researches are being conducted on Polish rivers now. The results of those researches will allow to obtain an even more successful identification of heavily modified water bodies.
